B0560LS-1WR2 is specially designed for applications where an isolated voltage is required in a distributed power supply system. It is suitable for:

1. Where the voltage of the input power supply is stable (voltage variation: $\pm 10\%V_{in}$);
2. Where isolation between input and output is necessary (isolation voltage $\leq 1500VDC$);
3. Where the output voltage regulation is not strictly required;
4. Typical application: digit circuit, normal low-frequency artificial circuit, data switching circuit and battery management system (BMS) with balance control scheme of power supply circuit condition, etc.

Design Reference

1. Typical application circuit

If it is required to further reduce input and output ripple, a filter capacitor may be connected to the input and output terminals, see Fig.3. Moreover, choosing a suitable filter capacitor is very important, start-up problems may be caused if the capacitance is too large. Under the condition of safe and reliable operation, the recommended capacitive load values are shown in Table 1.

Fig.3

Recommended capacitive load value table (Table 1)

Vin (VDC)	Cin (μF)	Single Vo (VDC)	Cout (μF)
5	4.7	60	10

2. EMC solution-recommended circuit

Fig.4

Input voltage (VDC)		5
EMI	C1	4.7μF /25V
	C2	100pF/50V
	C3	Refer to the Cout in Fig.3
	LDM	6.8μH
	CY	100pF/2000V

3. Output load requirements

In order to ensure the converter can work reliably with high efficiency, the minimum load should not less than 10% rated load when it is used. If the needed power is indeed small, please parallel a resistor on the output side (The sum of the efficient power and resistor consumption power is not less than 10%).
